Contents

Powers and indices

Coming up...

- Index notation and the laws of indices
- Using standard form

- Writing integers as a product of prime factors
- Finding the least common multiple and highest common factor of two numbers

The tower of Hanoi

This puzzle is called 'The tower of Hanoi'.

You have 3 poles and 4 coloured discs of different sizes set on one of the poles.

The aim is to move the discs onto one of the other poles.

There are two rules for moving the discs.

Rule 2: You must never put a larger disc on top of a smaller disc

1 Make your own Tower of Hanoi.

- Cut out 4 circles of card of different diameters to use as your discs.
- Make 3 large square bases for your towers.
- > Put the circles on one of your towers in order of size.
- 2 What is the smallest number of moves needed to move all your discs to another tower?
- 3 Investigate further for different number of discs.

Find a rule for the smallest number of moves, *m*, needed to move *d* discs from one tower to another.

1.1 Index notation

Skill checker

Make a copy of this cross-number and then solve the clues.

Across	Down
1 7 ³ - 5 ³	1 5 ²
4 3 ² + 4 ²	2 10 ³ - 5 ³
5 2×3^{3}	3 √256
6 $4^2 \times \sqrt{36}$	4 $6^2 - \sqrt{100}$
10 $2 \times \sqrt{100}$	7 3×6^{3}
11 $\frac{5^2 \times 4^3}{\sqrt{4}}$	8 $\frac{\sqrt{10000}}{2}$
	9 $\frac{6^3}{2^3}$
	10 5×2^2

Using indices

The next examples show you how to multiply and divide numbers written using index notation.

Worked example

Write $3^5 \times 3^4$ as a single power of 3.

Solution

 $= (3 \times 3 \times 3 \times 3 \times 3) \times (3 \times 3 \times 3 \times 3) \leftarrow$

 $= 3^9$ The powers have been added 5 + 4 = 9.

have been added 5 + 4 = 9.

Worked example

Write $3^6 \div 3^4$ as a single power of 3.

Solution

$$3^{6} \div 3^{4} = \frac{3^{6}}{3^{4}}$$
It is easier to write this as a fraction.
$$= \frac{3 \times 3 \times \cancel{3} \times \cancel{3} \times \cancel{3} \times \cancel{3}}{\cancel{3} \times \cancel{3} \times \cancel{3} \times \cancel{3}}$$
If you multiply by 3 and then divide by 3 it cancels out, so 4 of the 3s cancel from the top and bottom.
$$= 3 \times 3$$

$$= 3^{2}$$
The powers have been subtracted 6 - 4 = 2.

In the examples the base was 3, but the same would be true for any base.

Here are the rules for multiplying and dividing powers.

$$a^m \times a^n = a^{m+n} \qquad \qquad a^m \div a^n = a^{m-n}$$

For example, $9^3 \times 9^8 = 9^{3+8} = 9^{11}$

and
$$\frac{4^{12}}{4^7}$$
 or $4^{12} \div 4^7$ is $4^{12-7} = 4^5$

Sometimes powers involve brackets like in this next example.

Worked example

Write $(3^2)^4$ as a single power of 3.

Solution $(3^{2})^{4} \text{ means } \underbrace{(3^{2}) \times (3^{2}) \times (3^{2}) \times (3^{2})}_{4 \text{ times}}$ So $(3^{2}) \times (3^{2}) \times (3^{2}) \times (3^{2}) \times (3 \times 3) \times ($

(3²)⁴ is sometimes called a power of a power. Again, the example would have worked for any base, not just 3. Here is the rule for a power of a power.

 $[a^m]^n = a^{m \times n}$

For example, $(11^4)^5 = 11^{4 \times 5} = 11^{20}$

Copyright: Sample material

Take care! The bases must be the same - you can't combine powers if the bases are different. There is no way to simplify $3^7 \times 5^4$ any further.

There are 5 threes multiplied together multiplied by 4 threes

multiplied together which makes 9 threes multiplied together.

Carry on the table for the numbers up to 32.

6

7

8

Can all numbers be written using powers of 2?

d The table in part **c** is used to write numbers in **binary**.

In binary, 7 is written as $111 \mbox{ and } 8 \mbox{ is } 1000.$

Convert these binary numbers back to ordinary numbers.

1

- i 100000 ii 101010
- iii 1101011 iv 1000000

Each binary digit is called a 'bit'. The number 10000000 uses 8 bits, and 8 bits is called a byte. A kilobyte is 1024 bytes and a megabyte is roughly 1 million bytes. Binary numbers are used in computers to store information. Binary is a very powerful tool as data can be represented as strings of 0s and 1s which are represented as 'on/off' signals.

e Find out more about binary numbers and how they are used in computing.

1 🗲

7 = 4 + 2 + 1

- Can every number be represented as a binary number?
 - How do you think text is converted to binary?

Powers of 1 and 0

	Act	tivity	••••			
1	Con	nplete these.				
•	а	Use your calculator to work out				
:		i $3^7 \div 3^6$	ii	$4^8 \div 4^7$	iii	$9^{11} \div 9^{10}$
•	b	Use the laws of indices to write these	as a s	single power.		
		i $3^7 \div 3^6 = 3^{}$	ii	$4^8 \div 4^7 = 4^{\Box}$	iii	$9^{11} \div 9^{10} = 9^{\square}$
	С	What do you notice?				
•		Write down the value of 56 ¹ .				
2	Con	nplete these.				
•	а	Use your calculator to work out				
•		i $2^9 \div 2^9$	ii	$5^8 \div 5^8$	iii	$19^{3} \div 19^{3}$
•	b	Use the laws of indices to write these	as a s	single power.		
		$i \qquad 2^9 \div 2^9 = 2^{\square}$	ii	$5^{8} \div 5^{8} = 5^{\square}$	iii	$19^3 \div 19^3 = 19^{-1}$
•	С	What do you notice?				
		Write down the value of 56°.				

In the activity you found that

• any number to the power 1 is itself

• any number divided by itself is 1.

Using indices these are written as

 $a^1 = a$ $a^0 = 1$

Negative powers

Look at this pattern.

$$2^{3} = 2 \times 2 \times 2 = 8 \Rightarrow 2$$

$$2^{2} = 2 \times 2 = 4 \Rightarrow 2$$

$$2^{1} = 2 \Rightarrow 2$$

$$2^{0} = 1 \Rightarrow 2$$

$$2^{-1} = \frac{1}{2^{1}} = \frac{1}{2} \Rightarrow 2$$

$$2^{-2} = \frac{1}{2^{2}} = \frac{1}{4} \Rightarrow 2$$

$$2^{-3} = \frac{1}{2^{3}} = \frac{1}{8} \Rightarrow 2$$

You can carry on the pattern so $2^{-8} = \frac{1}{2^8}$ and $2^{-n} = \frac{1}{2^n}$ You could have used any base so you can say

 $a^{-n} = \frac{1}{a^n}$ (A negative power means '1 over'.

Roots

Worked example

Calculate

- a $5^4 + 4^5$
- **b** ⁵√343 ⁴√64

Solution

a $5^4 + 4^5 = 625 + 1024$ = 1649 **b** $\sqrt[5]{243} - \sqrt[6]{64} = 3 - 2$ = 1 Watch out! You can't combine sums and differences into a single power because the base number is different, so you just need to use your calculator to work these out.

1.1 Now try these

Write each expression as a power of 2. a $2 \times 2 $	1) Write each expression as a power of 2. a $2 \times 2 \times 2 \times 2$ c $2 \times 2 $		questions								
a $2 \times 2 \times 2 \times 2$ b $2 \times 2 $	a $2 \times 2 \times 2 \times 2$ c $2 \times 2 $	1 Write e	ich expression as	a power of 2.							
c $2 \times 2 $	c $2 \times 2 $	a 2	< 2 × 2 × 2				Ь	$2 \times 2 \times 2 >$	< 2 × 3	$2 \times 2 \times 2$	
Write each expression as a single power. a $7 \times 7 \times 7$ b $5 \times 5 \times 5 \times 5 \times 5$ c $14 \times 14 \times 14 \times 14 \times 14 \times 14 \times 14$ d $12 \times 12 \times 12 \times 12 \times 12 \times 12 \times 12$ a $8 \times 8 \times 8 \times 8 \times 8 \times 8$ f $33 \times 33 \times 33 \times 33 \times 33 \times 33 \times 33 \times 33$	2 Write each expression as a single power. a $7 \times 7 \times 7$ b $5 \times 5 \times 5 \times 5 \times 5$ c $14 \times 14 \times 14 \times 14 \times 14 \times 14$ d $12 \times 12 \times 12 \times 12 \times 12 \times 12 \times 12$ e $8 \times 8 \times 8 \times 8 \times 8 \times 8$ f $33 \times 33 \times 33 \times 33 \times 33 \times 33 \times 33 \times 33$	c 2	< 2 × 2 × 2 × 2 × 2 >	× 2 × 2 × 2 ×	< 2 ×	$2 \times 2 \times 2$	d	2 × 2 × 2 >	< 2 × 3	2 × 2	
a $7 \times 7 \times 7$ b $5 \times 5 \times 5 \times 5 \times 5$ c $14 \times 14 \times 14 \times 14 \times 14 \times 14 \times 14$ d $12 \times 12 \times 12 \times 12 \times 12 \times 12 \times 12$ e $8 \times 8 \times 8 \times 8 \times 8 \times 8$ f $33 \times 33 \times 33 \times 33 \times 33 \times 33 \times 33 \times 33$	a $7 \times 7 \times 7$ b $5 \times 5 \times 5 \times 5 \times 5$ c $14 \times 14 \times 14 \times 14 \times 14 \times 14$ d $12 \times 12 \times 12 \times 12 \times 12 \times 12 \times 12$ e $8 \times 8 \times 8 \times 8 \times 8 \times 8$ f $33 \times 33 \times 33 \times 33 \times 33 \times 33 \times 33 \times 33$	2 Write ea	ich expression as	; a single powe	er.						
c $14 \times 14 \times 14 \times 14 \times 14 \times 14 \times 14$ c $14 \times 14 \times 14 \times 14 \times 14 \times 14$ c $8 \times 8 \times 8 \times 8 \times 8 \times 8 \times 8$ c $3 \times 33 $	c $14 \times 14 \times 14 \times 14 \times 14 \times 14 \times 14$ c $12 \times 12 \times 12 \times 12 \times 12 \times 12 \times 12 \times 12$ c $8 \times 8 \times 8 \times 8 \times 8 \times 8 \times 8$ f $33 \times 33 \times 33 \times 33 \times 33 \times 33 \times 33 \times 33$	a 7	< 7 × 7				Ь	$5 \times 5 \times 5 >$	< 5 × !	5

	b	 i an ordinary number ii a power of 10. Write down 1 billion as i an ordinary number ii a power of 10. 	b	2.7 × = 2.7 × Work out the value Which of these is t number?	= 2700000 e of 2.7 × 10 ⁹ the correct way to say this
	с	A googol is 10 ¹⁰⁰ . Alfie writes a googol down as an ordinary number. How many zeros should follow the 1?	2.7 b 27 th	illion ousand million	27 hundred million 2 thousand 7 hundred million

Using standard form for large numbers

You often see headlines in newspapers that involve large numbers. For example, there are more than 400 billion Lego bricks in the world or there are 8.9 million school children in the UK.

In newspapers, large numbers are usually written using the words 'billion' and 'million' rather than being written out in full like this:

400 000 000 000 Lego bricks or 8 900 000 school children

In maths and science, large numbers are usually written using powers of 10

For example, 4×10^{11} Lego bricks or 8.9×10^{6} school children

Standard form is a way of writing down large numbers without writing down all the zeros.

A number is in standard form when it is written as

a number between 1 and 10 multiplied by a power of 10

In symbols this is written as

$A \times 10^{n}$

- A can be any number from 1 up to 10 (but not 10). \blacklozenge
- *n* must be an integer (whole number).

Powers and indices

Copyright: Sample material

 $1 \le A < 10$

Worked example

The Pacific Ocean has a surface area of $168\,000\,000\,km^2$. Write this number in standard form.

Solution

168 000 000 in standard form is $1.68 \times 10^{\circ}$ (*A* is always between 1 and 10.

Use a place value diagram to help you work out what the power of 10 should be.

НМ	ТМ	М	H Th	T Th	Th	Н	Т	0		t	h
								1	•	6	8
1	6	8	0	0	0	0	0	0			

$168\,000\,000 = 1.68 \times 10\,000\,000$

= 1.68 × 10⁸

You have to multiply 1.68 by ten 8 times to get 168000000.

So the Pacific Ocean has a surface area of $1.68 \times 10^8 \, \rm km^2$

You don't need to draw a place value diagram each time. The digits move 8 places so that the decimal point is now between the 1 and the 6, so you multiply by 10⁸.

0000000.=1.68×10⁸ ←

Count the arrows. They tell you the power of 10.

Using standard form for small numbers

Activity	• • • • • • • • • •	• • • •	
① Complete this pattern.	2	а	Work these out.
$10^{2} = 100^{2} = 100^{2}$			i 2×10^{-1} 2×10^{-2} 2×10^{-3}
$10^{1} = 10$			ii 84×10^{-1} 84×10^{-2} 84×10^{-3}
$\div 10 > 10^{\circ} = $			iii 7.9×10^{-1} 7.9×10^{-2} 7.9×10^{-2}
$\div 10$ $10^{-1} = 0.1$ $\div 10$		b	Complete each statement.
$10^{-2} = $			Multiplying by 10 ⁻¹ is the same as dividing by once
$10^{-4} = $			Multiplying by 10 ⁻² is the same as dividing by 10
			Multiplying by 10 ⁻³ is the same as dividing by 10

Worked example

A flea weighs around 0.000 087 kg.

Write this number in standard form.

Solution

A is always between 1 and 10.

0.000 087 in standard form is 8.7×10^{-5}

Use a place value diagram to help you work out what the power of 10 should be.

0	•	t	h	th	t th	t th	m
8	•	7					
0	•	0	0	0	0	8	7

 $0.000087 = 8.7 \div 10 \div 10 \div 10 \div 10 \div 10$

$$= 8.7 \times 10^{-5}$$

So the flea weighs 8.7×10^{-5} kg

1	Remember: dividing by 10 is the same as multiplying by 10 ⁻¹ .
	You have to divide 8.7 by ten five times to get 0.000 087.
	Dividing by 10 five times is the same as multiplying by 10^{-5} .
	You don't need to draw a place value diagram each time.
	You have moved the digits 5 places to get the decimal point between the 8 and the 7, so you multiply by 10^{-5}
	$0.000087 = 8.7 \times 10^{-5}$

Converting numbers from standard form

You also need to be able to convert from standard form back to ordinary numbers.

Remember when the power of 10:

- is positive, then the number is BIG
- is negative, then the number is SMALL.

Worked example

Convert these numbers from standard form to ordinary numbers.

a 5.67×10^4 **b** 3.08×10^{-6}

Solution

a 5.67×10^4 means you multiply 5.67 by 10 four times.

The digits move 4 places.

56700.

So 5.67 × 10⁴ = 56 700 ←

A positive power means the number is big!

b 3.08×10^{-6} means you divide 3.08 by 10 six times.

The digits move 6 places.

0.00000308

So $3.08 \times 10^{-6} = 0.00000308$

A negative power means the number is small!

Powers and indices

1.3 Prime factorisation

Skill checker

1 Look at the numbers in this box.							
	9	7	51	36	20		
	16	37	2	27	24		
	11	21	100	1	42		
	8	64	6	12	5		

(2) Write down the first ten prime numbers.

Remember Prime numbers are numbers that have exactly 2 factors: 1 and the number itself.

Write down all the numbers from the box that are

square а

- b cubes
- С factors of 36
- d prime
- multiples of 6 e
- f factors of 100 and prime.

Writing numbers as a product of prime factors

Remember that the factors of a number divide into it exactly. For example, the factors of 12 are 1, 2, 3, 4, 6 and 12 A prime factor is a factor of a number that is also prime.

The prime factors of 12 are 2 and 3.

Remember

1 is not a prime number.

Activity

Show that every number between 2 and 20 is either prime or can be made by multiplying prime numbers together.

Number	Answer		
2	2 (prime)		
3	3 (prime)		
4	2 × 2		
5	5 (prime)		
6	2 × 3		
7			

In the activity you found that every number up to 20 is either prime or can be made by multiplying together prime numbers. In fact, every whole number above 1 is either prime or can be made by multiplying together prime numbers.

This is known as the Fundamental Theorem of Arithmetic.

For example, $60 = 2 \times 2 \times 3 \times 5$

 $=2^2 \times 3 \times 5$

This is called a product **of prime factors**. Remember: product means multiply.

The next example shows you how to use a factor tree to help you write a number as a product of prime factors.

Worked example

Write 1540 as a product of prime factors.

Solution

Using a factor tree:

Finding the HCF and LCM of two numbers

The highest common factor (HCF) of two numbers is the largest factor that they share.

You can find the HCF of two numbers by listing their factors, as in this example for 20 and 30.

Factors of 20: 1 2 4 5 10 20

Factors of 30:1 2 3 5 6 10 15 30

The highest number in both lists is 10 so this is the HCF of 20 and 30.

The lowest common multiple (LCM) of two numbers is the lowest multiple that they share.

You can find the LCM of two numbers by listing their multiples, as in this example, again using 20 and 30.

Multiples of 20: 20 40 60 80 100

Multiples of 30: 30 60 90 120 150

The lowest number in both lists is 60 so this is the LCM of 20 and 30.

The next example shows you how to use a Venn diagram to help you find the HCF and LCM of two numbers.

Worked example

- a Show that 270 written as a product of prime factors is $2 \times 3^3 \times 5$.
- **b** Write 315 as a product of prime factors.
- C Find the HCF and LCM of 270 and 315.

Solution

a $2 \times 3^3 \times 5 = 2 \times 27 \times 5$

$$=10 \times 27 = 270$$

b 315

5 63

7 9

63 + 5 = 63

7 9

63 + 7 = 9

3 3 4 9 = 3 \times 3

Multiply together all the prime (circled) numbers in the factor tree:

 $315 = 5 \times 7 \times 3 \times 3$

$$=3^2 \times 5 \times 7$$

C $270 = 2 \times 3 \times 3 \times 3 \times 5$ and $315 = 3 \times 3 \times 5 \times 7$ Placing these factors in a Venn diagram gives

3, 3 and 5 are common factors so they go in the intersection. The intersection is the middle/crossover of the two circles.

,00

The HCF is found by multiplying the numbers in the intersection:

both numbers so when you multiply them together you'll get the highest common factor

These are the common factors of

The LCM is found by multiplying all of the numbers in the Venn diagram: 315

$$\underbrace{2\times3\times3\times3\times5}_{270}$$

Remember Writing a number as a product of its prime factors means writing all of the prime factors as a multiplication. Use index notation to write a product of prime factors neatly. Note Venn diagrams are covered in full in chapter 15 (unit 15.2).

> Check: 1890 = 6 x 315 which means 1890 is a multiple of 315 and $1890 = 270 \times 7$ which means 1890 is also a multiple of 270. Can you see why this method works?

There are 100 steps to the top of the tower. а The winner won by just 0.1 of a second. b The car costs £10 000. С 4 In the number 4.12×10^6 , the first digit has a value of 4 million or 4 000 000. The numbers in the table are written in standard form. Copy the tables and fill in the value of the first digit for each number. а b Number Value of first digit Number Value of first digit 2×10^{-2} 6.1×10^{4} 3.52×10^{4} 1.46×10^{-2} 3×10^{-4} 2.9×10^{7} 6.2×10^{-4} 1.352×10^{7} 4.5×10^{9} 5×10^{-6} 1.236×10^{9} 3.21×10^{-6} Find the LCM and HCF of these pairs of numbers by first finding their prime factors. 5 8 and 14 а b 30 and 35 С 18 and 24 **Band 2 questions** 6 Find the values of these. $(2^2)^3$ **b** $2^2 \times 2^3$ $2^{2} + 2^{3}$ $2^{3} \times 2^{3}$ а С d $2^5 \div 2^3$ **2**⁵ $2^{3} \times 2^{3}$ $2^{99} \div 2^{96}$ f e q h $[2 \times 2 \times 2 \times 2 \times 2]$ 7 Find the LCM and HCF of these pairs of numbers by first finding their prime factors. 80 and 100 **b** 210 and 240 а 8 Work out the missing digits in these. There may be more than one answer. =25 а 6 = С 9 Write these numbers in standard form. 2000 **b** 32 000 1450 d 36000000 а С D Write these numbers in standard form. 0.067 b 0.00341 0.000006 d 0.23 а С D Write these as ordinary numbers. 2×10^{3} **c** 4.56×10^4 5.6×10^{5} а **b** 1.4×10^2 d **g** 8.32 × 10⁻⁷ 3.576×10^{12} 2.7×10^{-3} 4.9×10^{-10} e f h

KEY STAGE 3 Mastering Mathematics

800A

Second Edition

w: hoddereducation.co.uk

Build fluency, reasoning and problem-solving skills with hundreds of expertly written questions that help to boost progression, alongside fun activities.

- Recap skills and topics throughout, ensuring a smooth transition to GCSE
- Build confidence with fun starter activities and warm-up questions
- Secure and deepen every pupil's understanding with differentiated questions and worked examples that follow the 'do it, secure it, deepen it' Mastery structure
- Develop reasoning skills through carefully constructed questions and the use of non-examples, where pupils identify mistakes in sample answers
- Track progress through review questions, so that you can be confident pupils are prepared for GCSE

Proven to boost progress – adopting a flexible Mastery approach

Written by subject specialists and UK Mastery-trained teachers for the National Curriculum, this book follows a Mastery learning approach that has been shown to improve progression by breaking down complex concepts into small steps.

This course is designed for flexibility with opportunities to introduce Mastery by using activities such as manipulatives, including bar modelling and algebra tiles, and the 'concrete, pictorial, abstract' approach where appropriate.
